

Safety certificate for recalibrations and reverifications of suspension / crane scales (max >50 kg)

Dear customer,
thank you very much for sending in your suspension / crane scales for recalibration/reverification.
The metrological test you ordered involves exposing your scales to their maximum load range.
For safety reasons, we test the weighing scales from the perspective of the lifting tackle as per DGUV Regel 109-017 before proceeding to the metrological test of the weighing scales.
This test serves to minimise our risk of damage to test equipment and persons caused by possible breakage of your suspension/crane scales.

Therefore we check the following main points before the metrological control of the suspension/crane scale:

1. Check of the marking (CE, year of manufacture, manufacturer, Max, etc.)
2. Function test (safety devices such as cotter pins, tabs, etc.)
3. Maintenance records (maintenance plan, logbook)
4. Visual inspection (cracks, deformation, wear, corrosion)

Unfortunately, we were not able to define the security risk beyond doubt during this review.

Therefore for the following scale we ask you

Manufacturer:

Model:

Serial number:

Company name:

Responsible user:

to confirm that:

1. The suspension/crane scale in your company has/will only be used in accordance with the recognized rules of technology, DGUV Regel 109-017 and within the manufacturer's specifications
2. Overloads and damages are not known

Legally binding signature of user

Company stamp

Thank you for your understanding.

After we have received your confirmation you will shortly receive your order confirmation and details of delivery.
